What do you do when your gas oven doesn't light

How do you light a gas oven without a pilot? How long does a gas oven igniter last? Why is my Frigidaire gas oven not heating up? How do you clean a gas oven igniter? How do you light a gas oven with an electric starter? Why is my gas stove not lighting? Can you use gas stove when power is out? How do you light a Ramton gas oven? Is it safe to light a gas stove with a lighter? Can a gas oven work without electricity? 1 Turn off the oven and make sure all the stove burners are off. Turn all the knobs on your gas oven and stove to "off". Make sure that your kitchen doesn't smell like gas before you try to light the oven.[2] The "off" position will be with the knobs turned all the way to the right and the dial facing straight up. Listen to make sure there is no hissing sound that means gas is coming out. Sniff for the smell of gas. 2 Open all windows and doors in your kitchen for ventilation. It's important to make sure your kitchen is well-ventilated before you try to light the oven to be extra sure there is no standing gas. This is especially important if you've already been trying to light the oven for a while and turning the knobs on and off.[3] Once you have ventilated the kitchen as much as possible, it's a good idea to let it air out for a few minutes if you were already trying to light the oven before. This will allow any gas sitting around to disperse. Advertisement 3 Open up the oven door to look for the pilot light hole. Open the oven door all the way to safely locate the pilot light. Make sure the door is all the way down and locked into place. Locating the light before you turn on the gas is important so that you don't leave the gas running while you search for it. 4 Look around the bottom of the oven for the pilot light hole. It is a small hole that is usually located in the front center, near the door, or in a back corner. Some ovens will have it labeled "pilot light".[4] If you don't see a hole in the bottom of the oven, and your model of oven has a broiler drawer at the bottom, then the pilot light could be in the back of the broiler drawer. 5 Clean the area around the pilot light hole with a microfiber cloth. Wipe away any grease and crust from around the pilot light to remove things that could catch on fire. Use a grease-fighting spray cleaner to get off any stubborn gunk.[5] This is an extra precaution and is more important if the gas stove and oven hasn't been used in a while and is particularly dirty. Advertisement 1 Push in and hold the oven knob and turn it to the "ignite" setting. Push in the oven knob with one hand so you can turn it and keep holding it until you have lit the pilot light. Turn it to the left to the "ignite" symbol or the first temperature setting.[6] Every oven model is different, but there should be either a little picture of a flame or the start of the temperature numbers right in the middle of the dial on the left hand side. This is where you want to turn the knob. 2 Hold a long match or lighter near or in the pilot light hole to light it. Light a long match with your hand that isn't holding the oven knob, or use a lighter with a long tip (like a BBQ lighter). Slowly move the flame towards the pilot light hole until it lights.[7] If you only have small matches, you can light one and drop it into the hole to be safe. Another alternative is lighting a twisted up piece of paper or a wooden skewer to use as the lighter. 3 Keep holding the oven knob for 10 seconds to let the pilot light heat up for about 10 seconds before you adjust the temperature. The pilot light will just go out if you try to change the oven's temperature too soon.[8] If you accidentally let go of the knob and the pilot light goes out, then you should turn everything off and start from the beginning. 4 Close the oven and adjust the temperature as needed. Shut the oven once you are sure the pilot light is staying lit. Turn the oven knob to the temperature you want to set it at.[9] If you have tried this process several times, and still can't light your gas oven, there may be a problem with the pilot light and you should call a professional to come take a look at it. Advertisement Add New Question Question 1 just bought a new gas oven. Will I need to light it myself? Gevorg Grigorian Appliance Repair Expert Gevorg Grigorian is an Appliance Repair Specialist and the Owner of G and R Appliance Repair in Los Angeles, California. Gevorg holds a BS in Business Administration and Management from California State University-Northridge. Support wikiHow by unlocking this expert answer. Newer gas ovens use an electric igniter, which means you don't need to light it yourself. All you need to do is turn the knob to the degree that you prefer and it will automatically turn on the flame. Ask a Question Advertisement Thanks! Advertisement Thanks! How do you light a gas oven without a pilot? How long does a gas oven igniter last? Why is my Frigidaire gas oven not heating up? How do you clean a gas oven igniter? How do you light a gas oven with an electric starter? Why is my gas stove not lighting? Can you use gas stove when power is out? How do you light a Ramton gas oven? Is it safe to light a gas stove with a lighter? Can a gas oven work without electricity? Gas ovens are a common sight in most household kitchens. Yet people who use it, especially older models, know of the troubles and frustrations that often result from trying to light the gas oven. Some gas ovens need you to hold a small flame for them to start burning, and this difficulty in lighting a gas oven sometimes discourages people from using them. However, this article will guide you on how to light a gas oven properly. Pilot Light If you're using a much older gas oven, this is one part of a gas oven that you need to be aware of. Modern gas ovens use an electric ignition system. In this system, electric sparks are used to ignite the burners. In most cases, this is simply done by pressing the ignition button. Pilot light or flame was a common part of older gas ovens. It is a continuously burning flame located under the kitchen stove. The user simply has to turn the gas stove on and let the gas pass over the flame. This will ignite the burners. Pilot lights work independently and eliminate the need for lighting via match. This is a much safer approach to lighting a gas oven that doesn't involve the risk of gas leakages and the possibility of an explosion. For gas ovens that make use of an electric ignition system, as long as the ignition system is working fine, you won't have difficulty starting up the oven. Gas ovens that use a pilot light or flame, however, might have their flames snuffed out. This is the primary reason why you might end up finding it extremely difficult to get your gas oven on at times. You could opt to replace a pilot light or relight it by taking apart the stove (make sure the stove is completely turned off). You can use a butane lighter for this or even a matchstick. Safety Precautions You Need to Take A gas oven can be extremely dangerous if you're not careful. While over the years, there have been numerous safety features built into gas ovens such as safety valves that prevent gas leakage. One misstep can still spell disaster. Some precautions you should always keep in mind are: Make sure the doors and windows in your kitchen are open. A lack of ventilation in your kitchen is bad as a build-up of gas will cause suffocation and is a massive hazard. A stray spark can easily cause an explosion. If possible, install an exhaust fan and keep your windows open. Proper ventilation is crucial. You should regularly check for any gas leaks or if your gas cylinder is compromised anyway. The smell of gas is a warning sign, and you should never attempt to light anything when you smell gas. Open all your windows and try to fan out the gas making sure to stop the leak. Keep your local gas company on speed dial for these types of situations. Always be careful and keep on the lookout. Always keep your stoves off when they are not in use. They consume gas and can prove to be a hazard if you're careless. Make sure the knobs are all correctly set to off (vertical position) and check if the flame has properly extinguished or not. Keep your stove and the area around your pilot light clean. Some grime can catch fire and damage the stove and hurt you. Use a spray cleaner for the best effects. Do not neglect cleaning the stove regularly as it can hamper performance. Lighting a Gas Oven How you light a gas oven primarily depends on what type of ignition system it has. Gas ovens with electrical ignition systems are simple in that they require just the press of the ignition button to start working. The general procedure of lighting a gas oven is as follows: Turn the oven knob to the temperature you want to set it at. Light the pilot light. Make sure all the safety precautions have been observed, especially make sure that there are no gas leakages and that any gas has been driven off. In your oven stove, observe the knobs. There will be a flame symbol denoting ignition. This symbol might vary, so it might be useful to check your instruction manual to get the proper symbol. Turn the oven knob towards that symbol. Locate the pilot hole. This is the hole through which the flame is emitted. It is usually located near the door of your oven. Open the door and look for a small hole at the bottom. It might be located at the back of some models. For this step, it is recommended to use a BBQ lighter as it is the safest option. It is long and will prevent your hand from being too close to the flame. Use the lighter near the pilot hole to light the flame. When the pilot flame has lit, make sure you keep holding the knob. This will let the flame heat up. Releasing it might cause the flame to be extinguished, and the whole process will need to be repeated. Once the pilot flame has lit and is burning, close the oven and regulate the temperature. Conclusion Hopefully, this article has given you an idea of how to go about lighting a gas oven and the necessary precautions you should take beforehand.
